FPS

Week 6

This is my first experience with coding so I'm still trying to wrap my head around everything. I only got some very basic things done, otherwise not much success.

I made different coloured FX for each of the targets but couldn't figure out how to apply them. I also made a small FX for when you hit the target instead of getting the big explosion every time.

Week 7

This week I decided to create multiple instances of doors and keys so that the player would have to find the corresponding key to progress but again could not figure out how to apply it.

I also made it so that the default orange door light turns on at the BeginPlay instead of only activating after first contact with its collision.

Week 8

This week was a little better for me things are starting to click. I made a new Battery BP and made it so you can walk into them to pick them up but only a maximum of three.

I also made a reload function where one of the batteries are consumed and your battery duration is restored to max.

Also using the flip flop I made it so you can open and close the door using E.

Week 9

For week 9 I started with making a HUD element that shows you how many spare batteries you're carrying. I also made a very simple place holder main menu screen that takes you to the first level and a health bar that serves no function for now since the enemies don't fight back.

I then used the the line trace to make the gun hitscan. This is just a personal preference since I didn't like the default projectile.
